

Settings.py

Settings.py gives to the user the capacity to edit the global variables of the project and the possibility to edit advanced settings.

 Download as .pdf!

PMID Settings

BASE_PMIID_URL: is a variable which set the link that is used to add to each PubMedID the pubmed article associated with it.

Paths Settings

You can use both Windows ('\\') and UNIX ('/') positioning, but beware that UNIX works on any OS while the windows one does not.

DOCS_PATH: is a variable which set the relative path where the json documentation files are stored.

GENE_TABLE_PATH: is a variable which set the relative path of the GeneTable file.

DISEASE_TABLE_PATH: is a variable which set the relative path of the GeneTable file.

Cache Settings

Here are settings used by flask-caching to store the tables and download them later.

CACHE_CONFIG: is a dictionary containing some options for the cache.
